

Announcing Audium Studio 5

The leading VoiceXML application creation and management environment just got better.

Prompt Manager enables user interface designers to edit and configure prompts from a global application view. Prompt manager's powerful sort and replace functions streamline the implementation of global changes in the application personality and feel.

Element Groups let developers view and save groups of elements as a single component that can incorporate any part of an existing callflow. Element Groups enable overview and detail views of complex processes, and can be saved as reusable templates.

Documenter is a powerful tool for exporting application data of all types. Use it to create application specifications, prompt lists for studio recording, simplify QA workflows, or provide business-level overviews of applications.

Decision Editor lets designers define and implement business logic for the IVR without coding. Business users can now create and configure dynamic VoiceXML applications that deliver a customized experience to each user.

Eclipse 3.1 Integration lets developers take advantage of all of the latest improvements to the leading Java IDE, use best-of-breed source control and versioning systems, or extend Studio's functionality with plugins from Audium partners or the Eclipse development community.

Audium is the worldwide leader in packaged VoiceXML application software, enabling intelligent, personalized voice applications using open standards and reducing costs. For more information, visit www.audiumcorp.com or call 1.877.AUDIUM.1
